Report: Regress Termination and Assurance Restoration

Test 1 — Regress termination

20 AI-generated governance artefacts, each with one deliberately seeded error, reviewed under both conditions (AI reviewer, human reviewer with sign-off authority). McNemar's test on paired catch/miss outcomes.

Measure	AI reviewer	Human reviewer
Errors caught (of 20)	13 (65%)	16 (80%)

Discordant pairs: human caught but AI missed = 6; AI caught but human missed = 3. McNemar's test: p = 0.508 (not significant in this sample).

Test 2 — Assurance restoration

30 governance stakeholders (internal auditors, risk officers, board members), each shown one of two process descriptions differing only in whether a human or an AI holds final sign-off. Independent-samples t-test on stated trust (1–7 scale).

Measure	Human-final-say condition	AI-final-say condition
Mean trust rating (1–7)	5.47	4.93
Would rely without double-checking	80%	40%

Independent t-test on trust rating: t = 1.556, p = 0.131 (not significant in this sample).
